What Is Claimed Is:

- 1. A device for triggering ignition circuits, the device having a positive and a negative output stage (1, 6, 8, 9) for each ignition circuit (17, 18), each positive output stage (1, 8) and each negative output stage (6, 9) being assigned a drive circuit (2, 7) and a diagnostic unit (4, 5), the positive and negative output stages (1, 6, 8, 9) being produced in pairs (12, 13, 14) on a common substrate, and a positive output stage and a negative output stage from different pairs (12 through 14) being provided for each ignition circuit (17, 18).
- 2. The device as recited in Claim 1, wherein the geometric distance between the positive and negative output stages of the same ignition circuit on the substrate is maximized.
- The device as recited in Claim 1 or 2,
 wherein the positive and negative output stages (1, 6, 8,
 9) of the same pair (12 through 14) are each connected to
 the same power supply.
